

## Four points on Pavillion

Encana and others look forward to seeing the EPA study on Pavillion groundwater undergo an independent, rigorous scientific review because natural gas plays a critical role in North America's need for cleaner, affordable, domestic energy. Here are four important points to consider:

- the EPA found no evidence of oil and gas impacts and no connection to hydraulic fracturing in Pavillion residents' drinking water
- the EPA drilled two deep monitoring wells into a known natural gas reservoir and to no one's surprise found components of natural gas
- the EPA released its preliminary findings without a truly independent, qualified third-party review
- that's why, for everyone from the Pavillion residents to those who make their living in the natural gas industry, we all need a truly independent panel of experts with widely recognized scientific knowledge to tell us what's going on with Pavillion groundwater

Encana works very hard to protect groundwater in all areas of our operations and we are committed to continuing our work with the community, the EPA and the state to resolve this matter.
